A biogas plant is a civil construction of an underground tank, which provides and anaerobic (air free) environment. All types of soft biomass wastes can be fed into this plant. Different types of bacteria decompose this feed material and generate biogas. Biogas is a combination of gases such as methane, carbon dioxide and hydrogen sulfide.

In order to plan a biogas plant and to design a digester, several design parameters must be determined which are: ratio of gathered waste fr om manure canals to total waste, number of cows in farm, amount of manure produced by a cow which is usually 1.8 m3cow-1month-1, quantity of daily liquid organic matter deposition into the digester, hy draulic retention time, density and quantity of daily dry organic matte r deposition into the digester, and digester load which is usually 2-4 kg m-3day-1.

Biogas is the mixture of gases produced by the breakdown of organic matter in the absence of oxygen (anaerobically), primarily consisting of methane and carbon dioxide. Biogas can be produced from raw materials such as agricultural waste, manure, municipal waste, plant material, sewage, green waste or food waste.Biogas is a renewable energy source. In India, it is also known as "Gobar Gas".
