PRESSURE AND FLUID STATICS This chapter deals with forces applied by fluids at rest or in rigid-body motion. The fluid property responsible for those forces is pressure, which is a normal force exerted by a fluid per unit area.

PRESSURE AND FLUID STATICS T

Chapter 2: Pressure and Fluid Statics Pressure For a static fluid, the only stress is the normal stress since by definition a fluid subjected to a shear stress must deform and undergo motion. Normal stresses are referred to as pressure p . For the general case, the stress on a fluid element or at a point is a tensor For a static fluid,

Fluid Mechanics Problems for Qualifying Exam

Fluid. A fluid is a substance, such as liquid or gas that has no rigidity like solids. Liquids are distinguished from gases by the presence of a surface. As fluids have no rigidity, they fail to support a shear stress. When a fluid is subjected to a shear stress, the layers of the fluid slide relative to each other.

Fluid Statics -Study Material for IIT JEE | askIITians

Fluid statics is the study of fluid problems in which there is no relative motion between fluid elements. With no relative motion between individual elements (and thus no velocity gradients), no shear can exist, whatever the viscosity of the fluid is. Accordingly, viscosity has no effect in static problems and exact analytical solutions to such problems are

For a fluid in motion, the volume flow rate gives the volume of fluid that passes a cross section per unit time and is given by Av , where A is the cross-sectional area of the tube and v is the fluid speed. Bernoulli's equation is used to solve some problems. It relates conditions (density, fluid speed,
